

FACT SHEET

ANGOPHORA COSTATA | 'SMOOTH – BARKED APPLE'

Example at Maturity

Foliage

Origin: Occurs from South Queensland to New South Wales on coastal heaths and open woodland.

Habit: Large evergreen tree. Though form may vary, generally occurs as densely foliated with a broad domed crown. A fast growing species that can attain a height of 15-18 metres over 40 years.

Description: Young leaves appear reddish, maturing to mid – green. Flowers are creamy – white appearing in December to January; very attractive. Bark smooth rusty – red, also very attractive.

Tolerances: An adaptable species, it is highly tolerant of drought though sensitive to water logging. Prefers full sun. Generally free of serious pests and diseases.

Notes: Formative prune to develop strong structure. A very handsome tree for urban areas. Suitable for planting under powerlines as it responds well to pruning.
