

EUCALYPTUS SCOPARIA | 'WALLANGARA WHITE GUM'

- Origin:** Originates on very dry, gravelly soils along the border between Queensland and NSW.
- Habit:** Typical mature height 12metres in 15 years. Sites for best growth relatively dry and well drained. Moderate to fast growth with sufficient water.
- Description:** Medium evergreen tree with a narrow domed canopy and pendulous habit, spreading crown with maturity. Narrow, peppermint scented dark green foliage. Smooth white bark. Common in public planting due to its vigour and moderate size. Suitable for broad streets. The foliage is lush, but the shade is not dense as the crown is quite spreading.
- Tolerances:** It is highly tolerant of dry, hot conditions, and will tolerate most urban compaction well. In Melbourne, this White Gum will tolerate most conditions, although there are no data to support its tolerance to water logging.
- Notes:** *E. scoparia* is not a 'replacement' for exotics or very small Australian trees such as *E. leucoxylon* ssp. *megalocarpa*; instead it is a mid-sized tree that can be best used in avenues or in parks.
